2454. Measuring energy emitted by electrically activated nitrogen.

H. Cygan, Acta phys. Polon., 11, No. 2, 189-194 (1952).

Rayleigh's work (Abstr. 1222 (1947)) on the measuring of energy emitted by electrically activated nitrogen was repeated, and the causes of the very high values of energy he obtained were studied. It is concluded that the results obtained by Rayleigh may be easily explained.

"Laboratory Diagnosis of Emphysematous Gangrene"

Lublin, Medycyna Weterynaryjna, Vol 22, No 5, pp 267-270

Abstract: A bacteriological examination was made of 23 cases of emphysema-tosis gangrene in cattle. A relatively fast and easy way of separating the bacteria is presented. A method is given for isolating pure broth cultures of Cl. chanvoei, which was identified by morphological, culture, biochemical and biological tests.

"The Use of Chicken Embryo Cell Cultures for Determining the Toxins of Clostridium Bacilli"

Lublin, Medycyna Weterynaryjna, Vol 22, No 7, 1966, pp 411-415.

Abstract: The effect is described of the toxins produced by Cl. perfringens type C, Cl. septicum and Cl. oedematiens on a culture of chicken embryo cells. It was found that all the strains investigated produced definite specific cytopathic changes after only four hours. Toxin determination sensitivity by the title method was compared with the lecithovitelline reaction on white mice. The former method was found more sensitive in investigating anaerobic bacteria. The method is claimed to be cheap, rapid, reproducible and giving uniform results.
Contains 5 Figures, 2 Tables and 18 references (2 Polish, 6 Western, 8 Russian, 1 Rumanian and 1 German-language).

microbes, including 15 strains of Cl. perfringens (62.5%), 4 of Cl. septicum (16.6%), 4 of Cl. sporogenes (16.6%), and one unidentified strain. The isolated perfringens and septicum strains were highly virulent and caused the death of guinea pigs in 12—36 hr. Cl. sporogenes proved to be nonvirulent. The Willis and Hobbs medium was best for quick strain identification, and for the simultaneous study of the lecithinase effect, presence of lipase, and fermentation of lactose. It allowed distinction of the Cl. perfringens, oedematiens, sporogenes, and botulinum strains. The Kalinin medium was best for showing blackening (3—4 hr) at the same time as curdling and digestion of milk. The Wilson-Blair medium was good only for approximate identification of microbial genera. Orig. art. has: 5 tables. [Based on authors' abstract] [W050]

Incidence of *Corynebacterium diphtheriae* in urine and
blood of diphtheria cases MED. DOSW. MIKROBIOL. 1955, 7/1 (41-
50) Tables 2

In the years 1951-1952 the authors had under their care 92 children with diphtheria and made studies with regard to the presence of *C. diphtheriae* in the blood and urine of the patients. The children were 2-7 yr. of age. The material for examination was taken when the children were fasting and they had already received penicillin and antidiphtheria serum. The blood cultures were positive in 9 cases out of 43 cases examined (20.9%); urine was positive in 21 out of 82 cases (25.6%). Out of the 9 cases in which *C. diphtheriae* were found in the blood 8 were type gravis, 1 type mitis. In the cultures from the urine only in 15 cases out of 21 could the type be determined: 12 were type gravis, 3 atypical, 2 type mitis. All these strains proved to be toxic for guinea-pigs. Positive results were obtained most frequently on the 3rd day of the disease. There was no parallelism between positive cultures from blood and those from urine. In the latter positive results were found in later days of the disease. The types of germs in the throat, blood and urine were the same. The methods of collecting material, preparation of cultures and differentiation of types are those usually employed.

SOURCE: Przeglad epidemiologiczny, v. 19, no. 3, 1965, 297-308
TOPIC TAGS: bacteriology, penicillin, streptomycin, erythromycin, neomycin, tetracycline, antibiotic
ABSTRACT: A comparative study of strains of Staphylococcus aureus resistant to penicillin, streptomycin, chloramphenicol, erythromycin, neomycin, oxy and tetracycline was made from the point of view of: source of strains; endocrine secretions; material (hospital or outside) and geographical distribution. Results revealed that least resistant to all antibiotics were strains isolated from food in case of food poisoning, and most resistant, those found in feces. The number of resistant strains was greater in hospital than outside material, except for neomycin. Of the antibiotics the

Card 1/2

Title : The Ammonia Method for Separating Mercury From
Iron.

Orig Pub: Chem. analit., 1957, No 2, 421-425.

Abstract: A method for the quantitative separation of Fe from mercury with ammonium hydroxide in the presence of large amount of ammonium salts is described. To prevent the separation of mercury and also its coprecipitation with iron, in the case of mercuric chloride, it is necessary to use a considerably larger amount of reagent, than in the case of mercuric nitrate. To the sample being analyzed, 15 milliliters of concentrated nitric acid is added,

"Bimanol in the Treatment of Post-Neuroleptic Apatheticabulic Syndrome in Schizophrenics."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 420 - 421

Abstract: 21 schizophrenics were given a treatment with phenothiazine derivatives combined with bimanol. Improvement occurred in 18 cases; the 3 in which it did not occur were hebephrenics. Previously apathetic patients displayed social activity. Bimanol administration following that of phenothiazine derivatives considerably improves patients suffering from Parkinson's disease. In some cases, however, a reverse action of bimanol was observed in this disease. The amount of phenothiazine when combined with bimanol can be reduced to about $\frac{1}{4}$ of the amount otherwise needed. 3 Western, 1 Polish reference. Submitted at the 8th Annual Psychopharmacological Meeting at Josenik, 19 - 22 Jan 66. Article is in English.

TITLE: Coagulation of polyacrylonitrile solutions

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24 (II), 1962, 833 - 834,
abstract 24P95 (Polimery, tworzywa, wielkocząsteczkowe, v. 6,
no. 11, 1961, 363 - 367 [Pol.; summaries in Eng. and Russ.])

TEXT: The coagulation of polyacrylonitrile from aqueous solution of dimethyl formamide was studied. The effects due to temperature and concentration of dimethyl formamide, and those due to concentration of polyacrylonitrile solution, on the transparency of films was determined. Photographs are given showing the microstructures of films obtained at concentrations of a dimethyl formamide solution between 30 and 70 % at 20°C and at 60 % at 15, 30, and 40°C. It was shown that a transparent gel without bubbles forms from the 40 - 60 % aqueous dimethyl formamide solution below 20°C and at a concentration of polymer (molecular weight 73 000) > 20 %.

of viscose rayon was investigated. The fibers were investigated with extraction degrees of 0, 15, 30, and 45 percent. On the basis of experimental data gathered into 11 tables and 5 graphs, the authors reach the conclusion that the orientation does not influence the degree of crystallinity of the fiber and its capacity for further crystallization. The process of extraction causes dissimilar growth of orientation in the total volume of the fiber: in the beginning the crystals are regulated, and the molecules of the amorphous areas are straight-
